

SYSTEM AND METHOD FOR PROVIDING A FAULT-RESILIENT BOOT

Abstract of Disclosure

A computer system configured to retrieve a preboot image from a first remote location and execute the preboot image. The preboot image is configured to cause the computer system to detect a status indication associated with a previous boot attempt by the computer system, and, in response to the status indication indicating a local boot attempt state, to retrieve a first boot image from a second remote location and to boot the computer system using the first boot image.
